# **IT-Security**

#### **Exercise 10**

\_\_\_\_\_\_

#### **Task 1: OWASP Dependency Check**

In this exercise, we use the OWASP Dependency Check to find outdated components or components with vulnerabilities in an application.

To do this, you must first install the **Command Line** Tool Dependency Check from OWASP:

- Download <a href="https://owasp.org/www-project-dependency-check/">https://owasp.org/www-project-dependency-check/</a> Command Line version
- 2. For installation, see <a href="https://jereub.io/DependencyCheck/">https://jereub.io/DependencyCheck/</a> and <a href="https://jeremylong.github.io/DependencyCheck/dependency-check-cli/index.html">https://jeremylong.github.io/DependencyCheck/dependency-check-cli/index.html</a>
- 3. Download the zip file and unzip it Extend the PATH variable with the bin directory of Dependency Check
- 4. Then the dependency-check commands can be called via cmd window

We are now reviewing the WebGoat application. This is an unsafe application of OWASP for training purposes.

- Download Web Goat "Standalone jars"
  <a href="https://owasp.org/www-project-webgoat/">https://owasp.org/www-project-webgoat/</a>
  or
  <a href="https://github.com/WebGoat/WebGoat/releases/tag/v8.2.2">https://github.com/WebGoat/WebGoat/releases/tag/v8.2.2</a>
- Open a console (cmd) and navigate to the folder where Webgoat's jar file is located
- Now use the OWASP Dependency Check to analyze the webgoat-server-8.2.2.jar file Command: dependency-check –s. webgoat-server-8.2.2.jar (Windows) dependency-check.sh –scan. webgoat-server-8.2.2.jar (Linux, Mac)

Look at the generated report and familiarize yourself with the terms CVE and CVSS. Use a search engine to find the discussions in the developer forums about the security issues. It is best to search for the CVE number. Get an overview of which vulnerability is a specific problem.

### Task 2: Dependency check of one of your current projects

Perform a dependency check of a project in which you are/were involved, e.g. your SEP project.

In addition to Java, other technologies are also supported: <a href="https://jeremylong.github.io/DependencyCheck/analyzers/index.html">https://jeremylong.github.io/DependencyCheck/analyzers/index.html</a>

Take a look at the report and consider whether you need to become active in your project.

## Task 3: Awareness Training Part 2

 $\underline{https://training.is\text{-}fox.de/fh\text{-}rosenheim\text{-}informatik}$ 

We complete the modules from out awareness Training in Exercise 1.

We start with the modules which are related to our chapter Authentication&Autorization

- Secure Passwords
- Password management
- Multi-factor authencation

Then we finish the training with the modules

- E-mail & phishing
- Sensitive information
- Social engineering
